Power line communication apparatus used in low-voltage installations - Radio disturbance characteristics - Limits and methods of measurement - Part 1: Apparatus for in-home use

This draft European Standard is submitted to CENELEC members for formal vote. Deadline for CENELEC: 2012-11-02.

It has been drawn up by CLC/TC 210.

If this draft becomes a European Standard, CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CENELEC in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning: This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

© 2012 CENELEC - All rights of exploitation in any form and by any means reserved worldwide for CENELEC members.

Foreword

This document (FprEN 50561-1:2012) has been prepared by CLC/TC 210, "Electromagnetic compatibility (EMC)".

This document is currently submitted to the Formal Vote.

The following dates are proposed:

- latest date by which the existence of this document has to be announced at national level (doa) dor + 6 months
- latest date by which this document has to be implemented at national level by publication of an identical national standard or by endorsement (dop) dor + 12 months
- latest date by which the national standards conflicting with this document have to be withdrawn (dow) dor + 36 months (to be confirmed or modified when voting)

This document has been prepared under a mandate given to CENELEC by the European Commission and the European Free Trade Association, and supports essential requirements of EU Directive(s).

For the relationship with EU Directive(s) see informative Annex ZZ, which is an integral part of this document.

The scope is extended to the whole radio-frequency range from 9 kHz to 400 GHz, but limits are formulated only in restricted frequency bands, which are considered sufficient to reach adequate emission levels to protect radio broadcast and telecommunication services and to allow other apparatus to operate as intended at reasonable distance.
Introduction

The European Committee for Electrotechnical Standardization (CENELEC) draws attention to the fact that it is claimed that compliance with this document may involve the use of a patent given in FprEN 50561-1:2012. CENELEC takes no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured CENELEC that he is willing to negotiate licenses under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with CENELEC. Information may be obtained from:

Sony Cooperation
Hiroshi Kamitani
IP Alliance & Licensing Department
1-7-1 Konan, Minato-ku, Tokyo 108-0075, Japan
Tel: +81-3-6748-3505
Fax: +81-6748-3544
Hiroshi.Kamitani@jp.sony.com

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those identified above. CENELEC shall not be held responsible for identifying any or all such patent rights.
1 Scope

This part of EN 50561 specifies limits and methods of measurement of radio disturbance characteristics for in-home communication apparatus that use the low-voltage power installation as the transmission medium. This part of EN 50561 applies to equipment that communicate over this medium in the frequency range 1.606 5 MHz to 30 MHz.

NOTE Similar equipment that communicate outside this frequency range is under study and will be covered by another European Standard.

Procedures are given for the measurement of signals generated by the equipment and limits are specified for the frequency range 9 kHz to 400 GHz. No measurement is required at frequencies where no limit is specified.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ITU-R Recommendation BS.560-3 2), Radio-frequency protection ratios in LF, MF and HF broadcasting

ITU-R Recommendation BS.703, Characteristics of AM sound broadcasting reference receivers for planning purposes

ITU-R Recommendation BS.1615 3), "Planning parameters" for digital sound broadcasting at frequencies below 30 MHz

2) BS.560-3 is superseded by BS.560-4, Radio-frequency protection ratios in LF, MF and HF broadcasting

3) BS.1615 is superseded by BS.1615-1, "Planning parameters" for digital sound broadcasting at frequencies below 30 MHz
3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1 AC mains power port
port that connects to the low voltage AC mains power network for the sole purpose of supplying electrical energy to the EUT

3.2 AC mains output port
port of the EUT that provides AC mains power to other apparatus

3.3 Artificial Mains Network
AMN
network providing a defined impedance at high frequencies across the power feed at the point of measurement of the terminal voltage, and also providing isolation of the circuit under test from the ambient noise on the power lines

Note 1 to entry: Such a network with a nominal impedance of 50 Ω/50 µH or 50 Ω/50 µH + 5 Ω is defined in EN 55016-1-2:2004, 4.3.

3.4 Associated Equipment
AE
equipment needed to maintain the data traffic on the cable attached to the EUT port under test and (or) to maintain the normal operation of the EUT during the test

Note 1 to entry: The AE can be another ITE, a traffic simulator or a connection to a network. The AE can be situated close to the measurement set-up, outside the measurement room or be represented by the connection to a network. The AE may be physically located outside the test area. The AE should not have any appreciable influence on the test results.

3.5 Equipment Under Test
EUT
representative equipment used for evaluation purposes

3.6 Impedance Stabilisation Network
ISN
symmetrical network for the measurement of the launched common mode disturbance signal transmitted by the EUT

3.7 in-Home PLC apparatus
PLC apparatus that connects to the low voltage AC mains power network and intended to be linked to other PLC apparatus connected in the same home
3.8 Information Technology Equipment

any equipment:

a) which has a primary function of either (or a combination of) entry, storage, display, retrieval, transmission, processing, switching, or control, of data and of telecommunication messages and which may be equipped with one or more terminal ports typically operated for the transfer of information,

b) with a rated supply voltage not exceeding 600 V

Note 1 to entry: ITE includes, for example, data processing equipment, office machines, electronic business equipment and telecommunication equipment.

Note 2 to entry: Any equipment (or part of the ITE equipment) which has a primary function of radio transmission and/or reception according to the ITU Radio Regulations is excluded from the scope of this European Standard.

Note 3 to entry: Any equipment which has a function of radio transmission and/or reception according to the definitions of the ITU Radio Regulations should fulfil the national radio regulations, whether or not this European Standard is also valid.

3.9 PLC apparatus

apparatus with a PLC port

Note 1 to entry: PLC apparatus are also called PLT apparatus.

3.10 PLC port

port that connects to the low voltage AC mains power network for the purpose of data transfer and communication, and may also supply electrical energy to the EUT

Note 1 to entry: PLC ports are also called PLT ports.

3.11 telecommunications/network port

point of connection for voice, data and signalling transfers intended to interconnect widely-dispersed systems via such means as direct connection to multi-user telecommunications networks (e.g. public switched telecommunications networks (PSTN) integrated services digital networks (ISDN), x-type digital subscriber lines (xDSL), etc.), local area networks (e.g. Ethernet, Token Ring, etc.) and similar networks

Note 1 to entry: A port generally intended for interconnection of components of an ITE system under test (e.g. RS-232, IEEE Standard 1284 (parallel printer), Universal Serial Bus (USB), IEEE Standard 1394 ("Fire Wire"), etc.) and used in accordance with its functional specifications (e.g. for the maximum length of cable connected to it), is not considered to be a telecommunications/network port under this definition.

Note 2 to entry: A PLC port is not considered a telecommunications network port in the sense of Definition 3.11.

3.12 user data

data originated from or destined to another device

3.13 'valid' radio broadcast service

radio broadcast service for which the field strength of the wanted radio signal at the location of the radio broadcast receiver is either at or above the minimum usable field strength level of 40 dB(µV/m) as defined by the ITU Radio Regulations and ITU-R Recommendation BS.703
4 Requirement for conducted disturbances at AC mains power ports

The AC mains power ports of the EUT shall comply with the Class B limits, using the measurement conditions and the methodology defined in EN 55022 for mains terminals.

5 Requirement for conducted disturbances at telecommunication/network ports

The Telecommunications/network ports of the EUT shall comply with the Class B limits, using the measurement conditions and the methodology defined in EN 55022 for these ports.

6 Requirements for conducted disturbances and communications signals at PLC ports

6.1 General requirements

The PLC port of the EUT shall comply with the following requirements:

In any operating condition, the unsymmetrical disturbances from the PLC port shall not exceed the disturbance limits given in Table 1 between 150 kHz and 1,606.5 MHz using the methods and procedures given in 9.1.

When user data is being transmitted by the PLC port, the disturbances from the PLC port may exceed the disturbance limits of Table 1 at frequencies between 1,606.5 MHz and 30 MHz provided that within:

- all the excluded frequency ranges given in Table A.1, the level of the transmitted signals shall comply with the disturbance limits given in Table 1 using the methods and procedures given in 9.1,
- all the excluded frequency ranges given in Table A.2, the level of the transmitted signals shall comply either with the disturbance limits given in Table 1 using the methods and procedures given in 9.1, or with the dynamic frequency exclusion requirements given in 6.2.

Without user data transmission, the unsymmetrical disturbances from the PLC port shall comply with the disturbance limits given in Table 1 between 150 kHz and 30 MHz using the methods and procedures given in 9.1.

The maximum transmitted signal from the PLC port shall not exceed the maximum values given in Table 2 measured using the methods and procedures given in 9.2.

The PLC port shall implement a dynamic power control function for the purpose of minimising the probability of radio disturbance whilst still maintaining communication. The dynamic power control function shall be capable of reducing the output power to the maximum levels given in Table 2 measured using the methods and procedures given in 9.2.

In order to ensure the inherent symmetry of the PLC port, it shall, in all operating conditions, comply with the disturbance limits given in Table 1 using the methods and procedures given in 9.4.
Table 1 — Limits for conducted disturbances

<table>
<thead>

<td>75</td>
<td>85</td>
<td>105</td>
</tr>
</tbody>
</table>

NOTE The transmit power management function of an AE should operate in the same way as the EUT otherwise the signal of the AE may dominate and cause erroneous results during measurement.

6.2 Specific requirements for dynamic frequency exclusion

Within 15 s of a ‘valid’ HF radio broadcast service being present within the excluded frequency band given in Table A.2, the transmitted PLC signal level shall not exceed a symmetrical voltage level of 56 dB(µV) (AV) in a 9 kHz resolution bandwidth.

NOTE 1 This level of the symmetrical voltage is derived from the EN 55022 Mains Conducted Class B disturbance limit (5 MHz to 30 MHz), which is $U_{\text{AMN}} = 50$ dB(µV) (Resolution Bandwidth 9 kHz, AV).

The transmitted PLC signal shall avoid using the frequency of an identified radio broadcast service. The minimum width of the excluded frequency band shall be 10 kHz (± 5 kHz centred on the carrier frequency of the broadcast signal). The excluded frequency band shall also comply with the requirements of Figure 1 in order to avoid adjacent channel interference, with respect to AM / DRM protection ratios as defined in ITU-R Recommendations BS.560-3, BS.1615 and BS.703, from transmissions outside the notch.

If several neighbouring radio broadcast services are identified or a digital (DRM) service occupying more than a single conventional channel, the width of the excluded frequency range shall be increased, scaled to integer multiples of 5 kHz.

NOTE 2 Usually, the channels of radio broadcast services are allocated with a minimum spacing of 5 kHz. Also, the centre frequency is a multiple of 5 kHz.

The excluded frequency band shall remain excluded continuously for the entire duration that the ‘valid’ radio broadcast service is present. After the detection of a ‘valid’ radio broadcast service has ceased, the excluded frequency band shall remain excluded for at least 3 additional minutes.
where

\[ \text{width} \geq 10 \text{ kHz}, \text{lower level} = 56 \text{ dB(µV)} (AV, \text{Resolution bandwidth 9 kHz}) \text{ and} \]

</tbody>
</table>

**Figure 1 — Minimum requirements for a dynamically excluded frequency range**

7 Requirement for radiated disturbances

The EUT shall comply with the Class B limits, using the measurement conditions and the methodology defined in EN 55022 for radiated disturbances.

8 Measurement conditions for PLC ports

The measurement of PLC ports shall be performed in conformance with EN 55022:2010, Clause 8.

The tests requiring the PLC modem function to be active shall be performed with the condition of PLC utilisation in excess of 10 % and with the transmit signal set at its maximum level maintained for a minimum of 250 ms. As an example, the transmission of a large data file could be used to exercise the port. Where this is not possible an appropriate configuration should be used that ensures the PLC transmission is active for a period of time long enough to allow for repeatable measurements in this state.

< Note to the NC’s (not to be included in final standard); “10 % utilisation” comes from EN 55022 (and CISPR 22); if a better wording comes in EN 55022 (or in future EN 55032), it will be taken over in the next revision of this European Standard >

No connection shall be made to any AC mains output port.
9 Measurement methods and procedures for PLC ports

9.1 Conducted unsymmetrical disturbances

The PLC port of the EUT shall be assessed using an AMN in accordance with EN 55016-1-2:2004, 4.3, the measurement method given in EN 55022:2010, Clause 9, for the mains ports and the arrangement shown in Figure 2 below for frequencies between 150 kHz and 30 MHz.

The coupling system (see Figure 3) shall

a) allow the EUT to be exercised by the AE,

b) have a sufficient loss to ensure signals from the AE do not influence the measurement result,

c) ensure that the EUT can transmit at its maximum power level.

The coupling system is required for

— providing a defined (symmetric) insertion loss between the EUT and AE,
— stabilisation of the differential mode impedance,
— attenuation of the differential mode signal of the AE,
— isolation of the common mode signal of the AE,
— filtering of the differential- and common mode signal from the mains.

Figure 3 shows an example of a coupling unit with a nominal insertion loss of 40 dB.

Measurements in the following operating conditions and configurations shall be performed:

1) with the PLC modem function of the EUT active and communicating to an associated PLC apparatus (AE) exercised in accordance with Clause 8, using its maximum transmit power the disturbance levels shall be measured in the frequency range from 150 kHz to 30 MHz. Above 1,606.5 MHz only the disturbances within the appropriate excluded frequency ranges need to be compared with the limits;

2) after completion of step 1, the exchange of user data exercising the EUT shall be terminated. Without user data transmission, the disturbance levels shall be measured between 150 kHz – 30 MHz.
NOTE 1  Distance from AE to the reference ground plane (vertical or horizontal) is not critical.

NOTE 2  Cable length between EUT and CS is 0.8 m (± 0.05 m).

Figure 2 — Test arrangement for measuring the PLC port with an AMN

9.2 Dynamic power control

The transmitted symmetrical signal from the PLC port of the EUT shall be measured for frequencies between 1.606 MHz and 30 MHz in order to ensure that the maximum transmit signal levels are not exceeded and to ensure the presence of a dynamic power control function. The PLC port shall be exercised in accordance with the operating conditions given in Clause 8. The measurements shall be made using a peak and an average detector; the detectors shall be in accordance with the requirements of EN 55016-1-1 including the 9 kHz requirement for the 6 dB bandwidth. An example test arrangement is given in Figure 4.

The transmit signal level shall be measured at all PLC transmission frequencies, with a symmetrical insertion loss between EUT and AE of 10 dB, 20 dB, 40 dB and 50 dB.
NOTE 1 The insertion power loss between the EUT and the AE is 10 dB to 50 dB adjustable in 10 dB steps.

NOTE 2 The insertion power loss between the EUT and the measurement receiver is nominally 20 dB.

NOTE 3 The insertion power loss between the signal generator and EUT is nominally 20 dB.

NOTE 4 The insertion power loss between the signal generator and the measurement receiver is nominally 6 dB.

NOTE 5 The above losses are determined as a part of the test equipment calibration; the actual figures should be used to correct the instrument readings to determine the levels that apply at the EUT terminals.

Figure 4 — Example test equipment arrangement for measuring PLC transmit signal levels

Figure 5 — Example schematic of 100 Ω to 50 Ω Balun
9.3 Cognitive frequency exclusion

Subclause 9.3 provides an option for demonstrating compliance of the EUT with the requirements given in 6.2 for dynamic frequency exclusion. If cognitive frequency exclusion is selected by the manufacturer, the EUT shall comply with the requirements of Annex C when tested using ingress signals in the excluded frequency ranges given in Table A.2. The measurement should be carried out using the arrangement given in Figure 4 of this European Standard.

NOTE Other options are under development.

For testing purposes, a radio broadcast service shall also be considered as ‘valid’ if the conducted signal appearing at the PLC port of the EUT in the test setup according to Figure 4 is $\geq -95$ dBm (in 9 kHz resolution bandwidth with an average detector).

9.4 Conducted asymmetric disturbances

The conducted asymmetric disturbances at the PLC port of the EUT shall be measured using the arrangement shown in Figure 6.

The insertion loss (symmetric) between the two ports of the coupling system shall be such that the link to the AE works properly and that the EUT transmits at its maximum power level. Figure 3 shows an example coupling system with a nominal insertion loss of 40 dB.

The ISN used shall have the characteristics specified in Annex B and shall be bonded directly to the reference ground plane.

NOTE 1 Distance from EUT to the reference ground plane (vertical or horizontal).

NOTE 2 Distance from AE to the reference ground plane is not critical.

NOTE 3 In case, the EUT has separate power connection to the mains.

NOTE 4 Coupling system (see Figure 3 for details of coupling unit) is required for

- providing a defined insertion loss between the EUT and AE,
- stabilisation of the differential mode impedance,
- attenuation of the differential mode signal of the AE,
- isolation of the common mode signal of the AE,
- filtering of the differential- and common mode signal from the mains.

Figure 6 — Test arrangement for measuring the conducted asymmetric disturbances from the PLC port
10 Measurement uncertainty

The results of measurements of signals or disturbances from PLC apparatus shall reference the measurement instrumentation uncertainty considerations where they are contained in EN 55016-4-2.

Determining compliance with the limits in this European Standard shall be based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty. However, the measurement uncertainty of the measurement instrumentation and its associated connections between the various instruments in the measurement chain shall be calculated and both the measurement results and the calculated uncertainty shall appear in the test report.
Annex A
(normative)

Excluded frequency ranges

Where frequency ranges overlap, due to dual use, between Table A.1 and Table A.2 the permanently excluded range in Table A.1 takes precedence.

NOTE: The bands in Table A.2 include frequency ranges allocated under Article 5 of the ITU Radio Regulations to the Broadcasting Service, plus a realistic appraisal of use for broadcasting under Article 4.4 of the ITU Radio Regulations.
Impedance Stabilisation Network (ISN) for asymmetric disturbance measurements

The ISN shall meet the following specifications in the frequency range of 1,606.5 MHz to 30 MHz:

- the common mode termination impedance at the EUT port shall be 25 Ω ± 3 Ω, phase angle 0° ± 25°;
- the differential mode impedance of the EUT port with the CS port terminated with 100 Ω ± 1 % shall be 100 Ω ± 10 Ω, phase angle 0° ± 25°;
- the decoupling attenuation (common mode isolation of the ISN excluding the Coupling System) between CS port and the ISN voltage port shall be:

\[ a_{\text{CISN}} = 20 \log \left( \frac{E_{\text{CISN}}}{2 \cdot V_{\text{CISN}}} \right) \geq 55 \text{ dB} \text{ minus Voltage Division factor} \]

NOTE 1 The Voltage Division factor, as defined in EN 55016-1-2, is normally a negative figure, thus it normally increases the required \( a_{\text{CISN}} \).

NOTE 2 The measurement arrangement for the common mode isolation \( a_{\text{CISN}} \) is shown in Figure B.2.

- the longitudinal conversion loss (LCL) of the ISN measured at the EUT port with the CS port terminated with 100 Ω ± 1 % shall be ≥ 55 dB;
- the attenuation distortion or other deterioration of the quality of signal quality in the wanted signal frequency band caused by the presence of the ISN shall not affect the normal operation of the EUT;

An example of a schematic diagram of an ISN is shown in Figure B.1.

Annex C
(informative)

Cognitive frequency exclusion

NOTE Annex C is derived from the relevant parts of ETSI TS 102 578 V1.2.1 (2008-08).

C.1 Abbreviations

For the purposes of Annex C, the following abbreviations apply.

AM Amplitude Modulation

DRM Digital Radio Mondiale (See ETSI ES 201 980 or http://www.drm.org/)

C.2 PLC apparatus broadcast radio detection

C.2.1 Overview

Signals from radio broadcast stations ingress onto the AC mains power network of homes. These ingress signals can be detected by PLC modems by comparing the ingress signal level at the PLC port with the noise floor.

C.2.2 Noise floor

The noise floor shall be measured by the PLC modem at adjacent frequencies lower and higher than the broadcast radio bands given in Table A.2. The adjacent frequency block to be monitored shall be as wide as the radio band allocation itself. The adjacent frequency blocks shall be completely monitored by the PLC modems without any gaps. The noise floor is the median value of all measured values of the electrical energy in the adjacent frequency blocks on the power line channel excluding all power line communication signals. An individual noise floor level shall be calculated for each broadcast radio band. The frequency locations and resolution bandwidth of the measured values is dependent on the PLC modem implementation.

A short impulsive noise e.g. caused by a light switch shall not influence the noise floor measurement.

C.2.3 Levels and thresholds

Signal ingress shall be identified as a receivable radio broadcast service if the signal is at least:

Criterion (1): $14 \text{ dB above the noise floor}$

If criterion (1) is satisfied, the threshold level of ingress of a broadcast signal identified as receivable is:

Criterion (2): $\geq -95 \text{ dBm (9 kHz Resolution Bandwidth, AV)}$

Additionally PLC modems may limit the identification of a receivable radio broadcast service to such signals that are AM or DRM modulated including very low AM modulated signals (plain carrier or a silent period).

The noise floor and broadcast radio signal shall be measured between the live and neutral conductor at the socket to which the PLC modem is connected. The measurement shall be made using a spectrum analyser or measurement receiver specified and adjusted as in EN 55016-1-1:2010, Clause 6.
The threshold is defined to take into account the sensitivity of broadcast radio receivers and reception factor between the field and the signals on the mains. The measurement bandwidth and detectors specified here are for verification of the implementation of the present document, which is described in detail in C.3.2. Resolution bandwidth and detectors used by the PLC modem are implementation dependent.

Taking into account the fading effects defined in ITU-R Recommendation BS.1615 and the robustness of radio receivers ETSI ES 201 980, the signal is considered to be present if criteria (1) and (2) are exceeded for at least 30 % of time in any 10 s interval.

C.3 Verification of the cognitive frequency exclusion implementation

C.3.1 Measurement arrangement

The implementations of cognitive frequency exclusion shall be verified using the measurement apparatus and arrangement shown in Figure 4.

C.3.2 Spectrum Analyser Settings

The spectrum analyser shall be configured as follows:

- Centre frequency: Carrier frequency of signal ingress
- Frequency span: 200 kHz
- Resolution bandwidth: 300 Hz
- Video bandwidth: 3 kHz
- Detector: Average or peak

C.3.3 Artificial Signal Ingress

Signal ingress shall be one or several signals at various frequencies of

- AM-Radio: modulated with a 1 kHz sine wave, 30 % modulation depth, or
- DRM: ETSI ES 201 980.

The strength of individual signals shall be equal to or higher than the level defined in C.3.4.

C.3.4 Levels and thresholds at verification-bench

C.3.4.1 Level of signal ingress

Using the arrangement shown in Figure 4 and the settings defined in C.3.2, the thresholds given in C.2.3 are verified by integrating the energy of the measured frequency points to a measurement bandwidth of 9 kHz (according to EN 55016-1-1:2010). Usually, spectrum analysers have a built-in function to do this. The attenuation of the measurement apparatus shall be added to the values from criterion (2).

The level of individual artificial signal ingress shall exceed these thresholds to enable a PLC modem to cognitively exclude these frequencies.
C.3.4.2 Lower level of the excluded frequency range

The lower level of the excluded frequency range shall be measured with the spectrum analyser configured in accordance with C.3.2. The measured Average level shall be less than - 89 dBm (see Note below for further detail on this value).

NOTE The lower level of the excluded frequency range is derived from EN 55022:2010 Class B mains conducted disturbance limit (5 MHz to 30 MHz) which is $U_{AMN} = 50 \, \mu V$ (resolution bandwidth 9 kHz, AV)

For verification of the mains port limits, an AMN (artificial mains network, specified in EN 55016-1-1) is used. It measures half of the differentially fed voltage at the measurement output. It follows that at the outlet $U_{outlet}$ where the PLT modem is connected, twice the differential voltage is present.

$$U_{outlet} = U_{AMN} \cdot 2 = 50 \, \mu V + 6 \, dB = 56 \, dB(\mu V)$$

For verification of the mains port limits, an AMN (artificial mains network, specified in EN 55016-1-1) is used. It measures half of the differentially fed voltage at the measurement output. It follows that at the outlet $U_{outlet}$ where the PLT modem is connected, twice the differential voltage is present.

Conversion from dB(µV) to dBm, using $Z = 100 \, \Omega$ conversion factor of 110 dB(mW/µV):

$$P_{outlet} = 56 \, dB(\mu V) - 110 \, dB(mW/\mu V) = - 54 \, dBm$$

$P_{outlet}$ of PLT modem at lower level of the excluded frequency range converting it to 300 Hz as specified in C.3.2:

$$P_{outlet} = -54 \, dBm - 10 \ast \log(\frac{9 \, kHz}{300 \, Hz})$$
$$= - 54 \, dBm - 14,7 \, dB = - 68,7 \, dBm$$

Considering the 20 dB attenuation of the measurement apparatus shown in Figure 4 the value displayed on the spectrum analyser should be

$$P_{displayed} = - 68,78 \, dBm - 20 \, dB = - 88,78 \, dBm \, (rounded \, to \, - 89 \, dBm)$$

C.3.5 Test procedure

The PLC system shall transport maximum payload as a continuous transmission. The following test sequence shall be performed.

Prepare the artificial ingress signal with 20 individual signals within the frequency ranges defined in Table A.2 and the communication spectrum of the EUT. The signal level of each individual ingress signal shall be as defined in C.3.4.1. A test signal is defined in C.4.

Tune the spectrum analyser to the centre frequency of the 1st artificial ingress signal.

Switch the artificial signal ingress on.

Monitor the spectrum analyser to confirm that the PLC signal is excluded and measure the excluded frequency range to ensure it complies with the requirements defined in 6.2.

Tune to all other frequencies where an artificial ingress signal is located.

Switch the artificial ingress signal off and monitor the spectrum analyser, to confirm that the PLC signal is not reused within the time specified in 6.2.
C.4 Test signals

A file containing a definition of a suitable test signal is available from http://pda.etsi.org/exchangefolder/ts_102578v010201p0.zip

The test signal modulates 20 individual signals within the HF broadcasting bands:

a) 10 AM signals generated at the following frequencies:
   - 4.75 MHz, 5.9 MHz, 7.2 MHz, 11.6 MHz, 11.62 MHz, 11.65 MHz, 11.69 MHz, 15.1 MHz, 21.45 MHz,
   - 25.67 MHz.

b) 10 DRM signals generated at the following frequencies:
   - 4.89 MHz, 6.2 MHz, 7.45 MHz, 11.61 MHz, 11.63 MHz, 11.66 MHz, 12.1 MHz, 15.8 MHz, 21.85 MHz,
   - 26.1 MHz.

AM and DRM signals alternate in the frequency domain.

Frequencies are chosen to be located close to the margins of the HF broadcasting bands. They are slightly modified to fit into a carrier spacing of 5 kHz and an integer number of wavelengths of the carrier frequency that needs to fit into the total signal length.

A group of 4 adjacent carriers should be generated (11.6 MHz, 11.61 MHz, 11.62 MHz, 11.63 MHz), one gap (11.64 MHz), 2 more carriers (11.65 MHz, 11.66 MHz), 2 gaps (11.67 MHz, 11.68 MHz) and one more carrier (11.69 MHz).

The sampling frequency is 80 MHz. Total signal length is 2 133 760 samples (26.7 ms).
Annex ZZ
(informative)

Coverage of Essential Requirements of EU Directives

This European Standard has been prepared under a mandate given to CENELEC by the European Commission and the European Free Trade Association and within its scope the standard covers the essential requirements as given in Article 1(a) of Annex I of Directive 2004/108/EC and the essential requirements of Article 3.1(b) (emission only) of Directive 1999/5/EC.

Compliance with this standard provides one means of conformity with the specified essential requirements of the Directives concerned.

WARNING: Other requirements and other EU Directives may be applicable to the products falling within the scope of this standard.
